EXERCISE 2
Organ Systems Overview

Time Allotment: 11/2 hours (rat dissection: 1 hour; if performing reproductive system dissection, 1/2 hour each for male and female; dissectible human torso model: 1/2 hour).

Homeostasis (FHS: 20 minutes, VHS, DVD, 3-year streaming webcast)
Homeostasis: The Body in Balance (HRM: 26 minutes, VHS, DVD)
Practice Anatomy Lab™ 3.0 (PAL) (PE: DVD, website)

Solutions:

Bleach Solution, 10%
Measure out 100 milliliters of household bleach. Add water to a final volume of 1 liter.

Laboratory Materials
Ordering information is based on a lab size of 24 students, working in groups of 4. A list of supply house addresses appears
Advance Preparation

1. Make arrangements for appropriate storage and disposal of dissection materials. Check with the Department of Health or the Department of Environmental Protection, or their counterparts, for state regulations.

2. Designate a disposal container for organic debris, set up a dishwashing area with hot soapy water and sponges, and provide lab disinfectant such as Wavicide-01 (Carolina) or bleach solution for washing down the lab benches.

3. Set out safety glasses and disposable gloves for dissection of freshly killed animals (to protect students from parasites) and for dissection of preserved animals.

4. Decide on the number of students in each dissecting group (a maximum of four is suggested, two is probably best). Each dissecting group should have a dissecting pan, dissecting pins, scissors, blunt probe, forceps, twine, and a preserved or freshly killed rat.

5. Preserved rats are more convenient to use unless small mammal facilities are available. If live rats are used, they may be killed a half-hour or so prior to the lab by administering an overdose of ether or chloroform. To do this, remove each rat from its cage and hold it firmly by the skin at the back of its neck. Put the rat in a container with cotton soaked in ether or chloroform. Seal the jar tightly and wait until the rat ceases to breathe.

6. Set out dissectible human torso models and a dissected human cadaver if available.

Comments and Pitfalls

1. Remind students that the rats are serving as model organisms for the human body. It is therefore important when working with rats to model the same types of behaviors we would use if working with a human cadaver. While excitement and enthusiasm are encouraged, students should be careful not to act in ways that might appear inappropriate or disrespectful of the specimens in the classroom.

2. Students may be overly enthusiastic when using the scalpel and cut away organs they are supposed to locate and identify. Therefore, use scissors to open the body. Have blunt probes available as the major dissecting tool.

3. Be sure the lab is well ventilated, and encourage students to take fresh air breaks if the preservative fumes are strong. If the dissection animal will be used only once, it can be rinsed to remove most of the excess preservative.

4. Organic debris may end up in the sinks, clogging the drains. Remind the students to dispose of all dissection materials in the designated container.

5. Inferior vena cava and aorta may be difficult to distinguish in uninjected specimens.

Answers to Pre-Lab Quiz (p. 15)

1. The cell
2. c, organ
3. nervous
4. urinary
5. diaphragm

Answers to Activity Questions

Activity 5: Examining the Human Torso Model (pp. 23–24)
2. From top to bottom, the organs pointed out on the torso model are: brain, thyroid gland, trachea, lung, heart, diaphragm, liver, stomach, spleen, large intestine, greater omentum, small intestine

3. Dorsal body cavity: brain, spinal cord

   Thoracic cavity: aortic arch, bronchi, descending aorta (thoracic region), esophagus, heart, inferior vena cava, lungs, trachea

   Abdominopelvic cavity: adrenal gland, descending aorta (abdominal region), greater omentum, inferior vena cava, kidneys, large intestine, liver, mesentery, pancreas, rectum, small intestine, spleen, stomach, ureters, urinary bladder

   Note: The diaphragm separates the thoracic cavity from the abdominopelvic cavity.

4. Digestive: esophagus, liver, stomach, pancreas, small intestine, large intestine (including rectum)

   Urinary: kidneys, ureters, urinary bladder

   Cardiovascular: aortic arch, heart, descending aorta, inferior vena cava

   Endocrine: pancreas, adrenal gland, thyroid gland

   Reproductive: none

   Respiratory: lungs, bronchi, trachea

   Lymphatic/Immunity: spleen

   Nervous: brain, spinal cord
### Answers to Group Challenge (p. 24)

Some possible answers to the questions are listed below. Student answers may vary.

<table>
<thead>
<tr>
<th></th>
<th>Which is the “odd organ”?</th>
<th>Why is it the odd one out?</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stomach</td>
<td>Small intestine Oral cavity</td>

</tbody>
</table>
2. Using the above key, choose the organ system to which each of the following sets of organs or body structures belongs.

   1. thymus, spleen,  
   e; lymphatic/immunity  
   lymphatic vessels  
   2. bones, cartilages,  
   j; skeletal  
   tendons  
   3. pancreas, pituitary  
   c; endocrine  
   adrenals,  
   4. trachea, bronchi,  
   i; respiratory  
   lungs  
   5. epidermis, dermis,  
   d; integumentary  
   and cutaneous sense organs  
   6. testis, ductus deferens,  
   h; reproductive  
   urethra  
   7. esophagus, large intestine, rectum  
   b; digestive  
   8. muscles of the thigh,  
   f; muscular  
   postural muscles

3. Using the key, place the following organs in their proper body cavity. Some responses may be used more than once.

   Key: a. abdominopelvic  
   b. cranial  
   c. spinal  
   d. thoracic  

   a; abdominopelvic  1. stomach  
   d; thoracic  7. heart  
   a; abdominopelvic  4. liver  
   d; thoracic  8. trachea  
   d; thoracic  2. esophagus  
   c; spinal  5. spinal cord  
   a; abdominopelvic  3. large intestine  
   abdominopelvic  6. urinary bladder  
   a; abdominopelvic  9. rectum

4. Using the organs listed in question 3 above, record, by number, which would be found in the abdominopelvic regions listed below.

   3, 6, 9  1. hypogastric region  
   1, 3, 4  2. right lumbar region  
   3, 5. left iliac region  
   3  3. umbilical region  
   1, 3  6. left hypochondriac region

5. The levels of organization of a living body include cell, tissue, organ, organ system, and organism.

6. Define organ. A body part (or structure) that is made up of two or more tissue types and performs a specific body function (e.g., the stomach, the kidney)
7. Using the terms provided, correctly identify all of the body organs provided with leader lines in the drawings shown below. Then name the organ systems by entering the name of each on the answer blank below each drawing.

Key: blood vessels heart nerves spinal cord urethra brain kidney sensory receptor ureter urinary bladder

![Human Anatomy Diagrams]

a. nervous system b. cardiovascular system c. urinary system

8. Why is it helpful to study the external and internal structures of the rat? *Many of the external and internal structures are similar to those in the human. Studying the rat can help you to understand your own structure.*
